

The JURA experiment

The first HE Long Baseline oscillation search

The first CERN SPS neutrino beam aimed at the JURA mountain, exiting at an altitude of 1200 m, 17 km from the production target

In 1981, proposal P158 studied the search for oscillations with a near detector on the CERN site and a far detector located in the mountain. Reachable limits were interesting.

The SPSC was convinced, but a higher power decided against
