

SEMINAR

For binaries with general eccentricity e

$$t_{GW} = \frac{5}{256} \frac{c^5}{G^3} \frac{a^4 (1 - e^2)^{7/2}}{m_1 m_2 (m_1 + m_2)}$$

Peters 1964

Timescale depends on semi-major axis, eccentricity, masses

Timescale extremely long

EXERCISE: calculate t_{GW} for 2 neutron stars
with mass equal to the Sun mass (1 Msun)
orbiting at the distance
between Sun and Earth (1 AU)

NS-NS merging time

$$G=6.67 \cdot 10^{-11} \text{ m}^3/\text{kg}/\text{s}^2$$

$$1 \text{ au} = 150 \text{ Mkm} = 1.5 \cdot 10^{11} \text{ m}$$

$$c = 300\,000 \text{ km/s} = 3 \cdot 10^8 \text{ m/c}$$

$$M = M_{\text{sun}} = 10^{33} \text{ g} = 10^{30} \text{ kg}$$

$$G \cdot M / c^2 / a = 6.7 \cdot 10^{-11} \cdot 10^{30} / 9 / 10^{16} / 1.5 \cdot 10^{11} \text{ m}^3 / \text{s}^2 / \text{m}^3 \cdot \text{s}^2$$

$$G \cdot M / c^2 / a = 5 \cdot 10^{-9}$$

$$T = 5 / 256 / 2 \cdot 1.5 \cdot 10^{11} / 3 \cdot 10^8 / (5 \cdot 10^{-9})^3 \text{ sec} = 5 \cdot 8 \cdot 10^{24} \text{ sec} = 1.5 \cdot 10^{18} \text{ yr} \gg t_U$$
